

Basic Installation: (Vac-Groom has been designed for easy installation.)

1. Simply plug the Vac-Groom hose into your vacuum system. Because of the noise factor associated with most systems, we highly recommend a permanent, remote installation. (See section on remote installation)
2. Next remove the blade from the clipper, slide on the Vac-Groom hose, replace the blade and go to work. (**Caution: Read the section on Grooming Tips before you begin)

Remote Installation:

Vac-Groom remote installation will eliminate the noise from most standard shop-vacs. It will also allow you to expand the system to suit your needs. Vac-Groom has been designed to attach 1 inch PVC piping which is available at all building supply stores. This will allow you the flexibility to customize the installation to fit the design of your shop. When assembling the PVC, only glue one side of the connectors at the corners. In the case of a clog, this will occasionally happen and in most cases can be cleared by removing Vac-Groom and using your force air dryer to blow the clog free. Most clogs will happen at the corners.

Contact your local Radio Shack for info on remote switching.
